

MOUSE

LEFT Button

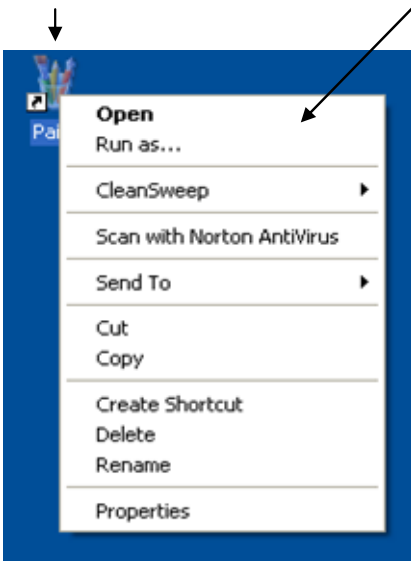

Pressing the LEFT Mouse Button will always cause some "action" to take place.

RIGHT Button

Pressing the RIGHT Mouse Button will always bring up a "menu" of available actions.

Shortcut Icon for "Paint" Program

Program Menu, brought up by "Right-Clicking" on the Icon

If the mouse is pointing at a folder, picture, or some other object, you can press the **RIGHT** mouse button to see a "menu" (or list) of the different things that you can do with that object. In this example, the mouse was on the "Paint" icon when the right button was clicked. That brought up this list of things you can do to this program.

To actually **DO** one of these actions, you have to select it from the list using the **LEFT** mouse button because only the **LEFT** button actually causes things to happen.

NOTE: the mouse pointer must always be on the item that you wish to use, before Right-Clicking it for a menu, because the menu will always be different, depending on which item you are pointing at.
